Education

08/2025 – Present	B.Tech Computer Science and Engineering in Data Science , <i>NxtWave Innovation of Advanced Technology in Collabroration with Ajeenkya DY Patil Pune</i> Pursuing B.Tech CSE (Data Science) via NxtWave's CCBP 4.0, in collaboration with Ajeenkya DY Patil University — a new age school , a hands-on, industry-aligned curriculum over traditional theory-only instruction.	Pune, India
-------------------	---	-------------

Skills

Languages Python, JavaScript, C++, HTML5, CSS3	Frameworks & Libraries React.js, Bootstrap, Tailwind CSS
Tools Git, GitHub, VS Code	Concepts OOP's, REST APIs, JSON, Responsive Web Design, DOM Manipulation, File Handling

Projects

06/2026 – 06/2026	Expense Tracker , <i>A multi-user expense tracker CLI built in Python — register, login, deposit, withdraw and track transaction history</i> <i>A multi-user command-line expense tracker built in Python using Object-Oriented Programming and JSON-based persistent storage.</i> • Built a multi-user CLI application in Python using OOP principles including classes, inheritance, and encapsulation • Implemented secure user authentication with login, registration, and session management stored via JSON files • Developed full transaction management supporting deposits, withdrawals, balance tracking, and transaction history • Added robust input validation and exception handling reducing runtime errors and improving application reliability Github : [https://github.com/Aryan-730/Expense-Tracker 🔗]
08/2026 – 08/2026	A ToDo Application , <i>A React-based task manager built with centralized state via Context API — add, edit, delete, and toggle tasks with zero prop-drilling</i> <i>A single-page task management app built in React, using the Context API for global state instead of local component state or third-party libraries.</i> • Built a centralized state management layer using React's Context API, exposing addToDo, updatedToDo, deletedToDo, and toggleComplete through a custom useToDo hook • Implemented ToDoProvider to wrap the app, allowing every component — form, list, and individual items — to read and update shared state without passing props down manually • Designed inline editing UX where clicking edit transforms a static todo item into a live input field in place, instead of routing to a separate edit view • Styled the entire interface with Tailwind CSS for a clean, responsive layout across devices Github: [https://github.com/Aryan-730/A-ToDo-Application 🔗 🔗] Live: [https://a-todo-application-tau.vercel.app/ 🔗 🔗]
